Documentation library

Markdown is the editable source. User-facing project documents have a generated PDF reading/printing edition; task reports are Markdown only. The build guide explains the Windows rebuild command, validation, and source/PDF consistency rules.

1. Project documents

Table 1. Project documents

Document	Source	PDF
Project assignment specification	Markdown	PDF
Step-by-step lab implementation guide	Markdown	PDF
Architecture and design	Markdown	PDF
Security requirements	Markdown	PDF
Test plan	Markdown	PDF
Acceptance criteria	Markdown	PDF
Project final report template	Markdown	PDF
Decisions	Markdown	PDF
Risks	Markdown	PDF
Authoritative references	Markdown	PDF
Terminology and status	Markdown	PDF
Documentation build instructions	Markdown	PDF

The final project report remains a clearly identified template. All infrastructure is PLANNED and its operational controls are NOT TESTED. No PDF adds implementation, certification, or owner acceptance claims.

2. Task reports and other instructions

The task-report index links the sequential Markdown-only reports and addenda. The entire `reports/` directory, including its index, is excluded from PDF generation. Finalized Markdown remains immutable. Existing report PDFs are retained as optional historical archives and are not regenerated or required for later reports.

PDF editions also accompany the root project overview and agent governance, infrastructure guidance, configuration guidance, evidence handling, and bootstrap evidence. This library index is available as PDF too.

The two root-level decision/risk compatibility pages preserve old links in immutable reports. They point to the maintained governance documents and are not duplicate PDF sources. The generated manifest lists every approved source/PDF pair and its content hashes.
