Documentation library

Markdown is the editable source for project documents, which have generated PDF reading/printing editions. The lab deliverable templates are editable Word/Excel files with no PDF editions; task reports are Markdown only. The build guide explains the Windows rebuild command, validation, and source/PDF consistency rules.

1. Project documents

Table 1. Project documents

Document	Source	PDF
Project assignment specification	Markdown	PDF
Step-by-step lab implementation guide	Markdown	PDF
Architecture and design	Markdown	PDF
Security requirements	Markdown	PDF
Test plan	Markdown	PDF
Acceptance criteria	Markdown	PDF
Project final report template	Markdown	PDF
Decisions	Markdown	PDF
Risks	Markdown	PDF
Authoritative references	Markdown	PDF
Terminology and status	Markdown	PDF
Documentation build instructions	Markdown	PDF

The design uses a physical HP desktop for bare-metal OPNsense and a Dell Precision 5820 with Proxmox VE for three workload virtual machines. Management is reserved for administration, Corporate contains DC1 and WIN1, and Restricted contains APP1.

2. Editable lab deliverable templates

The assignment defines these five active blank templates. Complete them during approved lab work. Actual observations, execution dates, evidence, results and scores start empty; engineering tests start NOT TESTED and owner acceptance starts PENDING.

Table 2. Editable lab deliverable templates

Editable template	Requirements	Owning record
01 Environment and architecture	FWR-01, FWR-02	Hardware readiness, three workloads, three zones, permitted flows and the capacity budget
02 Identity and Zero Trust implementation	FWR-03 to FWR-06	AD and separate application roles, endpoints, HTTPS, six cases and Tailscale/revocation summaries

Editable template	Requirements	Owning record
03 Security monitoring and testing	FWR-01 to FWR-10	Five event categories, one denial investigation, ten tests/91 mandatory subchecks, coverage, one automation/restore, evidence and separate owner acceptance
04 Troubleshooting and lessons	FWR-10	One issue log with cause, correction, verification/retest and lesson
05 Final project submission	FWR-10	Results summarized by reference, limitations, 100-point rubric and supporting deliverables

Use Segoe UI answer areas and status dropdowns; add table rows when records grow. The testing workbook owns detailed execution so other files reference it. PASS requires every mandatory subcheck and evidence; blocked or missing work cannot become a passing test or an approved omission. Keep private working copies and originals outside Git and publish reviewed summaries only.

Run `python scripts/validate_office_templates.py` for offline package and content checks.

The eight verified blank T5 shells were retired by normal Git changes. Their complete original template directory and T5 report snapshot preserve historical links and definitions. Old targets/results do not govern this baseline. Finalized reports remain unchanged.

3. Task reports and other instructions

The task-report index links the sequential Markdown-only reports and addenda. The entire `docs/reports/` directory, including its indexes, is excluded from PDF generation. Finalized Markdown remains immutable. Existing report PDFs are retained as historical archives and are not regenerated or required for later reports.

PDF editions also accompany the root project overview and agent governance, infrastructure guidance, configuration guidance, evidence handling, and bootstrap evidence. This library index is available as PDF too.

Compatibility pages under this directory preserve old decision/risk links and the relative links in relocated immutable reports. The aliases under `docs/docs/` and `docs/evidence/` point to maintained sources or unchanged evidence; they receive no PDFs. The manifest alias is a small JSON navigation record, not a duplicate manifest. The generated manifest lists every approved source/PDF pair and its content hashes.
