Evidence handling

This public folder accepts only individually reviewed, sanitized evidence. Raw captures, logs, backups, screenshots, and exports stay in private owner-controlled storage outside the repository. Task 001 does not create implementation evidence.

For each future record, include an evidence ID (`EV-<test>-<date>-<sequence>`), requirement and test IDs, stage, UTC timestamp, tool/version, scoped synthetic source/target roles, expected and observed outcome, verdict, operator, independent verification method, and sanitization review. Record engineering verification and owner UAT in separate fields. Mark missing evidence **NOT RUN**, not passing.

Suggested public filename: `EV-T06-YYYYMMDD-01.md`. Preserve original evidence privately with a SHA-256 digest and a private custody record. Hash the sanitized artifact separately; do not imply that it is byte-identical to the original. Publish only necessary synthetic excerpts, redact addresses and identifiers, and inspect the rendered image/text and metadata. Keep private record locations out of public reports.

The test plan defines the future evidence required for each outcome. Documentation check results support repository quality only and cannot demonstrate operational security.
