HL-CYB-001

T2 report - Documentation quality and readability

Enterprise Zero Trust Security Architecture

Document version 6ffbf30e74f5

Report state: FINALIZED

Contents

1. A. Task Information 3

2. B. Implementation Summary 3

3. C. Testing and Validation 4

4. D. Security and Quality Review 4

5. E. GitHub Operations 5

6. F. Outstanding Issues 5

7. G. Completion Status 6

8. H. Next Task 6

9. Historical README command example 6

Report state: FINALIZED

1. A. Task Information

Table 1. A. Task Information

Field	Record
Task ID	T2
Title	Documentation quality and readability
Execution date	2026-11-05, America/Toronto
Scope and objectives	Make public documentation clearer for business and technical readers, preserve technical requirements/commands/control design, and establish mandatory writing standards
Dependencies	Owner documentation-quality addendum; completed reporting governance, finalized T1, authenticated repository access, and existing documentation validator
Branch / baseline	`task/002-documentation-readability`; merged main `20c5bb491927c513b8773ead7ecda76716c23b89`
Finalized on / evidence cutoff	2026-11-05, America/Toronto; reconciled commit `0731efb4e39be6e796998b813c1c7f96ad4032dc`, passed local comparisons/tests, and successful push/PR CI read-back

2. B. Implementation Summary

Reviewed README, assignment, implementation guide, architecture, security requirements, acceptance criteria, test plan, risks, reporting instructions, final project template, references, and historical reports. Revised the business explanations, guide steps, and status language; retained historical records without editing them. Added a shared glossary and mandatory public-writing rules. The README was reduced from 1,010 to 700 words and distinguishes the business problem, objectives, architecture, actual repository tools, planned lab technologies/controls, implementation status, validation, documentation, workflow, and repository information. No lessons or achievements were invented for an unimplemented lab.

Created `docs/GLOSSARY.md` and `reports/T2-Report.md`. Modified `README.md`, `AGENTS.md`, `docs/PROJECT-ASSIGNMENT.md`, `docs/LAB-IMPLEMENTATION-GUIDE.md`, `docs/ARCHITECTURE.md`, `docs/SECURITY-REQUIREMENTS.md`, `docs/ACCEPTANCE-CRITERIA.md`, `docs/TEST-PLAN.md`, `docs/RISKS.md`, `docs/DECISIONS.md`, and `reports/README.md`. Reviewed the project final report template and reference catalog without changing them. Detailed Git guidance stays in AGENTS.md; the original README command example is preserved below as a historical reference.

No infrastructure, software, VM, network, production, credential-store, license, or repository-protection change is authorized. Finalized T1, its reporting addendum, and bootstrap evidence remain unchanged. The baseline includes the owner's `eb50d3f` README edit removing the prominent status banner. A later owner edit, `f450b39`, removed the introductory Task 001 completion sentence. Both choices were preserved: the revised README has no restored banner or deleted introductory sentence, and status/evidence appear in their dedicated sections. The later main change was reconciled through a normal merge into the task branch without rewriting history.

3. C. Testing and Validation

Table 2. C. Testing and Validation

Check / command	Expected result	Actual result	Status
`python scripts/validate_docs.py`	Working links/structure/traceability/rubric/report/publication checks	Twenty-six candidate files, twenty-one Markdown files; checks passed	PASS
`python -m unittest discover -s tests -v`	Existing eighteen focused tests pass	All eighteen tests passed with normal filesystem permissions	PASS
Exact implementation-guide command comparison	Executable examples unchanged from the task baseline	All eight fenced command examples matched the baseline exactly	PASS
Requirement/control/flow/capacity/rubric comparison	Existing technical tables and IDs unchanged	Fourteen technical tables across five documents matched exactly; full T00-T20 catalog/coverage index unchanged	PASS
Historical report/evidence digest comparison	Finalized T1/addendum and bootstrap evidence unchanged	All three files matched their baseline bytes and SHA-256 digests	PASS
`git diff --check` and authored-content review	Clean formatting and only authorized public text changes	Passed; writing reviewed and listed stock marketing phrases absent	PASS
Reachable history and commit-metadata review	Public text scan clean; new publication identity uses noreply	Historical text blobs had no selected findings; three existing commits had non-noreply author/committer email fields at the review cutoff	FAIL for historical noreply policy; existing finding recorded without exposing addresses
GitHub branch/PR CI and metadata	Exact reconciled head passes actual checks and uses noreply metadata	Push run 42144303257 and PR run 42144309637 succeeded on `0731efb`; that merge's author/committer were both noreply	PASS
Final report-publication merge/main synchronization	Finalized report pushed, latest CI/review conditions checked, normal merge, matching main refs	Follows this evidence cutoff; verify in final response and PR record	NOT TESTED at cutoff; no future result claimed

4. D. Security and Quality Review

Reviewed public-safe text only. Exact command blocks, requirement/control/flow/capacity/rubric tables, security boundaries, standards mappings, and the test catalog were preserved. The prose now explains purpose and recovery without claiming those procedures ran. Operational controls remain PLANNED / NOT TESTED. No implementation, business outcome, performance metric, compliance result, independent human review, or owner acceptance was invented. New-file and historical-text scans found no selected sensitive-data patterns; this does not cover every possible secret.

Commit-metadata review found non-noreply author/committer emails in existing commits `eb50d3fe692f3a087eaeed423710c2a9994575d4` and `f450b3992752eb8289089c3e0c2e7e6f3c07b6ac` (owner README edits) and `20c5bb491927c513b8773ead7ecda76716c23b89` (the GitHub-created PR 1 merge). The merge used the account's web/API email rather than the configured local noreply identity. This distinction was missed before that merge and is now recorded in RK-17; addresses are deliberately omitted. No credential or key finding was identified.

Existing history remains intact. New commits/merges must verify both noreply fields; the intended PR 2 publication uses a normal local merge only after exact-head CI/review requirements pass, followed by remote/PR read-back. GitHub documents commit email preferences and recognition of merges outside the PR button. No account privacy setting or history rewrite is authorized here. Historical remediation remains an owner decision.

5. E. GitHub Operations

Table 3. E. GitHub Operations

Item	State at draft creation
Repository / branch	`waqashamdani-ca/enterprise-zero-trust-security`; `task/002-documentation-readability`
Dependency PR	PR 1 merged at `20c5bb491927c513b8773ead7ecda76716c23b89`; local and remote main matched and were clean before this branch
Dependency merge CI	Run 42141674074: success
Verified implementation commits	`96deb1be52b78275b46071a72365e2f5dac6cbfb`; reconciled head `0731efb4e39be6e796998b813c1c7f96ad4032dc`
Pull request	PR 2, open and mergeable at cutoff
T2 CI	Push run 42144303257 and PR run 42144309637: success, including eighteen tests
Merge / synchronization	Not merged at cutoff; task branch clean and tracking its remote after preserving owner commit `f450b39`; final report publication/read-back follows
Approval conditions	Owner authorized documentation changes and normal GitHub operations; no protected-branch/ruleset review requirement was configured; owner UAT remains PENDING

6. F. Outstanding Issues

Documentation editing, comparisons, local tests, and implementation-commit push/PR CI are complete. Publishing this final record and its CI/merge/main read-back follow the cutoff and must be checked before the completion response. No documentation/command/control regression was found by focused checks. RK-17 remains an existing historical email-metadata finding requiring an owner decision; it has not been erased or silently waived. Owner UAT and independent human review have not been supplied. Hardware, backup, egress, licensing, provider, and repository-protection decisions remain outside this task. The bootstrap's external-reference reachability limitations remain; no new reachability result or lab-command execution is claimed. Readability is an editorial review, not a measured user-study result.

7. G. Completion Status

Table 4. G. Completion Status

Area	Status
Engineering	Documentation scope IMPLEMENTED and VALIDATED; report finalized; final publication read-back follows the cutoff
Independent verification	Exact command/table/catalog/history comparisons and hosted CI passed; no independent human review claimed
Owner UAT	PENDING
Remaining owner decisions	Acceptance of documentation and scope-specific approval for any future implementation

8. H. Next Task

The owner subsequently authorized documentation folder organization and reproducible PDF deliverables. After T2 is finalized, merged, and synchronized, assign that documentation-only scope T3. Its prerequisites are environment/toolchain inspection, preservation of finalized sources and evidence, faithful PDF rendering, and a separate report. That authorization does not permit Proxmox installation, VM creation, network changes, or infrastructure/security testing. Any later Stage A readiness task still requires its own explicit owner approval.

9. Historical README command example

The README's detailed Git workflow is now linked to AGENTS.md. This original bootstrap branch example is retained verbatim for traceability. It was not executed by T2 and does not name the actual T2 branch or authorize hardware work; T2 uses `task/002-documentation-readability`.

```
git switch main
git pull --ff-only origin main
git switch -c task/002-hardware-readiness
```
